## **Focus, Method, Calling and Creation: On Charting a Professional Course in Child and Adolescent Psychiatry**

### **Abstract**

This is a personal reflection on how to think of a career in child and adolescent psychiatry, particularly intended for someone getting started on one. In some ways this is a continuation of a short paper I wrote in 2005: Martin, A.: Ignition Sequence: On Mentorship (Perspective). *Journal of the American Academy of Child and Adolescent Psychiatry* 2005; 44(12): 1225-1229.

**Focus, Method, Calling and Creation:**

**On Charting a Professional Course in Child and Adolescent Psychiatry**

Where your deep gladness meets the world's deep hunger  
is where you should be: there lies your vocation.

*—Adapted from Frederick Buechner*

Early in my career, and periodically since then, I have been asked what 'T-shirt' it is that I wear. The question has not been meant literally of course, but rather as a proxy for what it is that I *really* focus on in my work, what the true aim of my professional effort is all about. Twenty-plus years since graduating from fellowship, I continue to find the question as difficult to answer—and as anxiety-provoking—as when I first struggled with it long ago. The question is not only fair game, but indeed one coming from a place of caring: well-intended colleagues interested in my progress and development curious to learn about my goals and priorities. And who could blame them? As the saying goes, 'if you don't know where you're going, any road will get you there'. In light of which, knowing one's eventual destination and pursuing it with a laser-like aim is surely the way to move forward and succeed in a professional career. Or so I had been led to believe.

Being asked what T-shirt I wear remains just as unsettling as that other dreaded question, a staple at cocktail parties and social gatherings: 'what is your research about?' As I mumble, blush and try to shift the conversation to the weather, I find it hard

to confess and disappoint: I don't have an actual portfolio, I don't conduct original research of my own. Can we still be friends? Impostor syndrome rears its ugly head.

Having worn many an ill-fitting T-shirt throughout my professional career, and having arrived at certain midlife realizations regarding who I am (and more importantly, regarding who I am *not*), I would like to share what I have learned along the way. By broadening the standard sartorial repertoire beyond T-shirts, my hope is to help others ease into their very own, personally-tailored shirts.

### **Standard T-Shirt Models: Focus and Method**

Reflecting back on his prodigal career, my mentor and dear friend, the late Donald J. Cohen, articulated how he had very early on zeroed in on a specific disorder (his *focus*, his *what*) and on a specific toolkit (his *method*, his *how*):

I had a different goal—to pursue a narrow phenomenon to its roots. What if we could learn everything about a simple tic— where did it come from, what made someone vulnerable, what neurons and neurochemicals were involved, how did it get expressed or held back? How did other children feel about a child with tics, and how did their feelings make a child feel about himself? I had outlined a program of research.<sup>1</sup>

The hallmark of the *focus* T-shirt is being able to wear one boldly emblazoned with a given diagnosis (Cohen had two such shirts, one reading 'Autism', the other 'Tourette's syndrome'). The content and aim of a career is its *what*: a commitment to a

specific phenomenon (or condition, disorder or population; or beyond psychiatry more broadly, to any discretely circumscribed entity or topic).

By contrast, *method* T-shirt wearers are proud to identify the approaches at the core of their expertise (Cohen had several such shirts: ‘developmental psychopathology’, ‘psychoanalysis’ and ‘neurochemistry’, among the more heavily worn). The means to pursue a question are its *how*, a powerful approach in that it can be applied to multiple goals at once.

The problem for me lay in liking too many *what’s*, but not one of them so much as to want to make it my own. The humble tic, by virtue of being as small and narrow, had proven irresistible for my mentor, the perfect soil on which he went on to plant and harvest through the methodological *how’s* of biology, genes, imaging and psychoanalysis. No such luck for me –or for many, perhaps most of us. The focus and method T-shirts may be best fitting for those pursuing careers in “uppercase-R” Research, aiming to be principal investigators, leaders of programs that create new knowledge; in brief, “all-in” scientists or clinician-scientists). Having one of each two T-shirts may in fact be required for success in Research, particularly when defined through clearly-defined metrics that are either fiscal (NIH priority scores, dollar amounts in grant funding) or academic (scholarly output, bibliometric indices).

But for those of us who don’t have as defined and explicit a goal, who may be fulfilled with “little-r” research projects (in education, training or quality improvement, for example), for those with no academic interests at all –indeed for each and every one of us, there certainly is a shirt out there waiting to be worn, even if not in one of those two particular T-shirt models.

### **Team's Jersey: Calling**

By virtue of our long training we have been socialized to set out goals and pursue them doggedly. We would not be physicians today, let alone medical specialists and sub-specialists, had we not set out to master such decade-long to-do lists. Given this professional upbringing, it is only natural that we are keen on pursuing targeted goals. Noble and worthwhile as this approach is, I would argue that we have done much less for ourselves and for our trainees, when it comes to heeding to the calls coming our way. Overtly centered on *what* and *how* we want to pursue, we all too often lose sight of the *where* and the *who* reaching out our way. To misquote JFK, we should not ask what we can do for our country, but rather listen to what our country may be asking of us.

The term 'calling' is usually understood in the sense of altruism, of doing something for its own good rather than for the rewards it may bring. In the case of medicine, for example, our calling may be less about wanting to 'fix' (as this would entail that our patients are somehow 'broken'), to 'cure' (as we often 'manage' instead, particularly chronic conditions), or to 'benefit' (financially or otherwise). Instead, our calling is around a wish to *serve* others, to ease their suffering when we can, and to bear witness and accompany them along the way even when we can not.

There is another way of conceptualizing 'calling', a more literal way, one more akin to 'listening'. Each one of us has to identify where it is that we are geographically, institutionally, and professionally situated at any given time –weighty decisions regarding the *where* and the *whom* in which to build a residency, a fellowship, or a longer-term settled life. These places and individuals can, and often do change over time. It is perfectly acceptable, normative in fact, to change 'teams', and as such, to

change the 'jersey' of one's affiliation. But once settled in and donning your team's jersey, the key is to listen attentively to what it is that may be missing, to what your location, your colleagues and your community may be lacking. With the serious workforce shortage in child and adolescent mental health across our country and the world, you can be certain that there will be much that is needed and will be asked of you: it is up to you to listen in, as multiple fronts are sure to be *calling* on you.

As child and adolescent psychiatrists, the search for those elusive T-shirts may be actually quite simple, the answers laying hidden in plain sight all along. Our focus is on children, adolescents, their families and the communities in which they live; our method, the vast toolkit of our profession. The two axes of our focus and our method thus effectively ground and place us. As we then settle on a given team's jersey, we can set out to find out what in its lineup may be lacking. Each and every team will need and call upon you; it is up to you to heed the call. Whether at a clinic, school, hospital or any other setting; whether at an academic institution or not; whether as a trainee, as someone in active practice, or as someone approaching or having crossed retirement, you'd better listen up, for the call is surely there.

Having to periodically change teams, jerseys and locations necessarily implies that flexibility and an ability to adapt to new environments are critical developmental traits. As such, it behooves us to hone in on those aspects in ourselves – and to make sure we teach them to others along the way. Specifically, there are two critical skills to refine, arguably the only two we need to focus on: 1) Learning to learn, and 2) Learning with others.

The pace at which knowledge advances, and the seemingly inexhaustible range of resources at our disposal require a different approach to learning. The information contained in the static books and lectures of old can no longer be our mainstays today. Learning how to learn requires dynamic skills that are iteratively refined, lifelong, web-/distal- as well as person-based, asynchronous as well as synchronous, self-initiated, trainee- rather than trainer-centered, and responsive to actual challenges at the individual, community or policy levels. As specialists dedicated to development and to human interaction, we are in a privileged position to learn not only *about* others, but *with* others. Indeed, few of us can conceive of practicing alone: our work is multidisciplinary and relationship-based at its core.

### **Professional Bespoke: Creation**

Identifying a job and devoting one's life to it is a formerly effective approach to employment that has diminishing relevance in today's world. And what is true for workers of factory plants, rustbelts or mechanized farms, is similarly applicable to us as medical professionals: we are overwhelmingly likely *not* to sustain one single job for life. We should celebrate the fact. We should embrace our new opportunities –we should be instrumental in their creation.

*The job that you will have some day does not yet exist.* When I first heard these words from a well-meaning mentor, I was scared silent. Inventing a future job from scratch appeared too ill-defined, amorphous and inchoate a proposition for someone as comfortable with structure, security and predictability as I was. However, time has proven the prescient wisdom of those words, as I have seen myself and so many of my

colleagues 'reinvent' themselves professionally – moving in a way that hardly seems linear at the time, but that on retrospect seems so natural, predestined almost. If these words are scaring you like they once did me, or if they simply sound too abstract and amorphous in themselves, let me be more direct, more prescriptive even.

Your very own shirt, the one tailored to your unique dimensions, this one-of-a-kind bespoke, may not yet exist. It is up to you to design this beautiful shirt of yours. And if you can think of no way of doing so, let me invite you to a challenge that helped me as a first-time tailor. For starters, think of how you can give back. Whether your reach is local or global; whether it centers on patients, parents or professional colleagues; whether it is through fiscal, volunteer, docent or any other means, you can give back. And when you think back to the first three shirts you have worked so hard to make your own, bear in mind that you have skills: you have a focus (children), a method (your child psychiatry toolkit), and a team to call your own (your location calling on you). The one thing remaining to be done is to have those hard-earned skills meet with a commitment to service: it is at the intersection of skills and service that you will be able to give back, and in so doing, to live a more fulfilling life, both professionally and personally.

I have had the privilege of intersecting my skills with my need to give back. A bicycle, of all things, helped me along the way<sup>2</sup>. The cycling *maillot* I created in so doing is surely not to be my last one. I don't know what the next item in my professional wardrobe will be. Perhaps you don't know about yours either.

Don't worry if you can't figure out all of your apparel at once; the clothing items may be reached at sequentially, but then again may not. Anticipate that your shirts will

change over time: after all, a static wardrobe is the end of fashion. As a thought experiment, try to lay out your shirts –don't fret if things don't quite fit. Give yourself the time to find out what gives you real joy, what is that deep gladness looking to break out of you. Embrace, find, or reconnect with your vocation. You will find it at the crossroads of your deep gladness and the deep hunger out there –a hunger so keenly felt by those we are privileged to serve.
